**INTRODUCTION**

Various types of diseases can involve the nasal vestibule. Vestibule masses are relatively common and most of them are vestibule cysts. Rarely they seen in infant population and fibromas are very rare.

**CASE:**

5-months-old girl referred to our clinic with difficulty in breast feeding. Her left nostril was blocked by a mass and family also suffer from breathing. MRI scans showed no connection with cranium. Simple mass was seen in the scans. Total excision was done and the lesion pathologically diagnosed fibroma.

**CONCLUSION:**

Nasal vestibule masses especially in infants can cause difficult breast feeding. After careful examination treatment mostly simple for experienced surgeons.
